Abstract 1

Studying star-forming galaxies with integral-field spectroscopy

We present a new analysis of star-forming galaxies using integral-field spectroscopy. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 2

Studying cosmic voids with deep learning

We present a new analysis of cosmic voids using deep learning. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 3

Studying cosmic voids with a new calibration pipeline

We present a new analysis of cosmic voids using a new calibration pipeline. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 4

Studying quasar absorption lines with deep learning

We present a new analysis of quasar absorption lines using deep learning. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 5

Studying high-redshift galaxies with deep learning

We present a new analysis of high-redshift galaxies using deep learning. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 6

Studying high-redshift galaxies with a Bayesian framework

We present a new analysis of high-redshift galaxies using a Bayesian framework. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 7

Studying high-redshift galaxies with deep learning

We present a new analysis of high-redshift galaxies using deep learning. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 8

Studying gravitational lensing with integral-field spectroscopy

We present a new analysis of gravitational lensing using integral-field spectroscopy. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 9

Studying high-redshift galaxies with a Bayesian framework

We present a new analysis of high-redshift galaxies using a Bayesian framework. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 10

Studying the intergalactic medium with integral-field spectroscopy

We present a new analysis of the intergalactic medium using integral-field spectroscopy. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 11

Studying high-redshift galaxies with a new calibration pipeline

We present a new analysis of high-redshift galaxies using a new calibration pipeline. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 12

Studying gravitational lensing with deep learning

We present a new analysis of gravitational lensing using deep learning. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 13

Studying high-redshift galaxies with deep learning

We present a new analysis of high-redshift galaxies using deep learning. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 14

Studying the intergalactic medium with deep learning

We present a new analysis of the intergalactic medium using deep learning. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 15

Studying the intergalactic medium with deep learning

We present a new analysis of the intergalactic medium using deep learning. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 16

Studying gravitational lensing with deep learning

We present a new analysis of gravitational lensing using deep learning. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 17

Studying galaxy clusters with integral-field spectroscopy

We present a new analysis of galaxy clusters using integral-field spectroscopy. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 18

Studying galaxy clusters with a new calibration pipeline

We present a new analysis of galaxy clusters using a new calibration pipeline. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 19

Studying gravitational lensing with a new calibration pipeline

We present a new analysis of gravitational lensing using a new calibration pipeline. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 20

Studying gravitational lensing with forward modelling

We present a new analysis of gravitational lensing using forward modelling. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 21

Studying dark matter halos with integral-field spectroscopy

We present a new analysis of dark matter halos using integral-field spectroscopy. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 22

Studying gravitational lensing with deep learning

We present a new analysis of gravitational lensing using deep learning. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 23

Studying galaxy clusters with a new calibration pipeline

We present a new analysis of galaxy clusters using a new calibration pipeline. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 24

Studying cosmic voids with deep learning

We present a new analysis of cosmic voids using deep learning. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 25

Studying cosmic voids with a new calibration pipeline

We present a new analysis of cosmic voids using a new calibration pipeline. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 26

Studying the intergalactic medium with integral-field spectroscopy

We present a new analysis of the intergalactic medium using integral-field spectroscopy. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 27

Studying dark matter halos with mock catalogues

We present a new analysis of dark matter halos using mock catalogues. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 28

Studying cosmic voids with a Bayesian framework

We present a new analysis of cosmic voids using a Bayesian framework. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.

Abstract 29

Studying high-redshift galaxies with a Bayesian framework

We present a new analysis of high-redshift galaxies using a Bayesian framework. Our approach reduces systematic uncertainties by a factor of two compared to earlier work. We discuss implications for current models and outline prospects for upcoming surveys.
